The Lamp Genie –

1.0 Proposal

For my Individual project, I will be creating a website for a local craftsman. My aim for the website is to showcase his work and be able to reserve products for collection or order online. The main products that will be stocked on the site are handmade bottle lamps, the lamps can be made from any glass bottle of the customers choosing.

1.1 Website

The Website will consist of 4 pages, the home page, the product page, a gallery and an about page. Each page will go into further detailing.

Home page will consist of an overview of the products, with a bootstrap carousel showcasing some of the products.

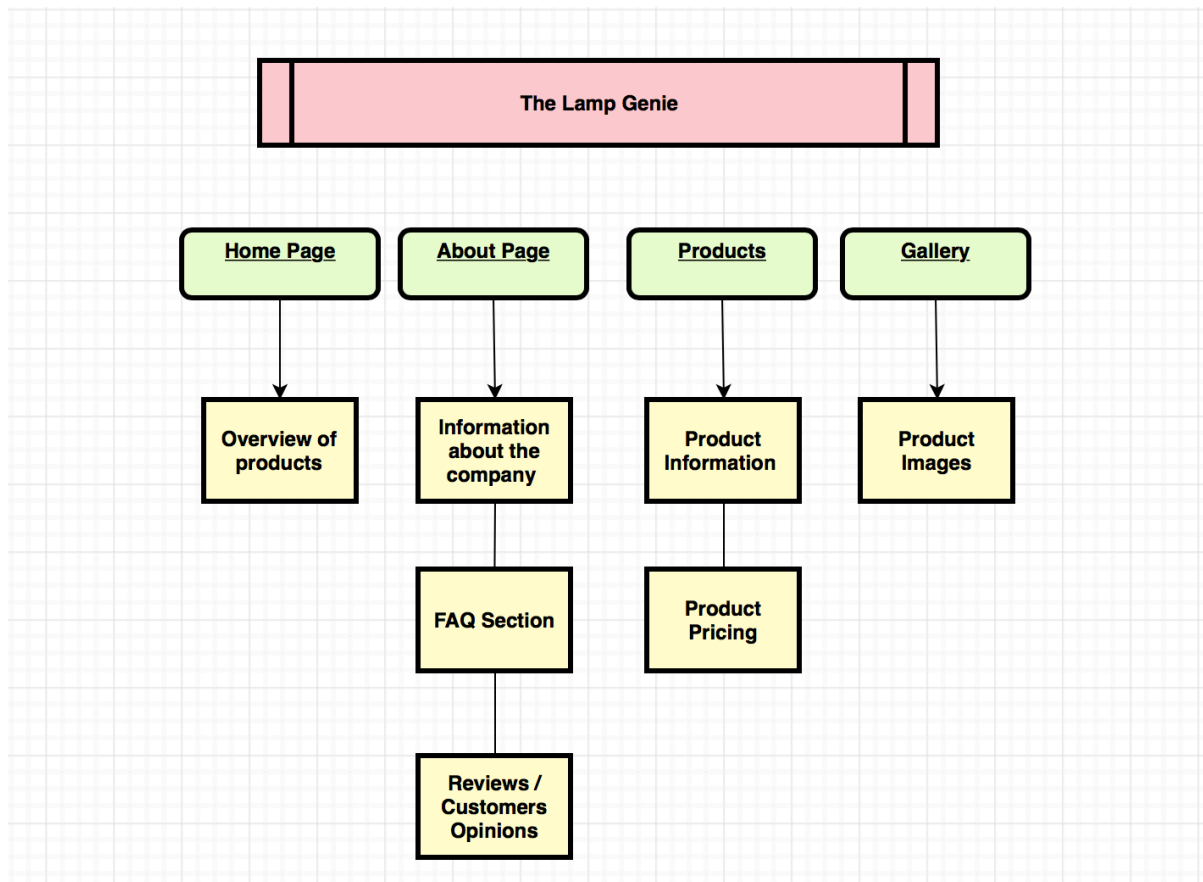

The about page will provide information about the company, it will have a frequently asked question section and once the business grows it will have a show some reviews from customers.

The Products page will have information on all products for sale and their pricing.

Lastly will be the gallery page which will showcase photos of the products from different angles and in different lighting.

2.0 Content flow chart

I have created a content flowchart to give the company an idea of what the website will consist of. I created this flowchart in draw.io

2.1 Wireframe

2.2 Mock-Up of Final Website

Technical Spec and Languages

I will be using a mix of different programming languages and applications ranging from coding to photo editing.

To build my website I will be using

- HTML
- CSS
- JavaScript
- Bootstrap
- PHP
- And some basic Java

For the application to write the code and edit the photos I will be using:

- Visual Studio Code
- Adobe Photoshop

For my equipment, I will be using:

- Nikon D3200 DSLR camera
- Softbox lighting
